DSS Consulting has 20 years of experience in the field of decision support – data warehouse development, analysing and reporting systems, data cleansing and data mining. DSS was a pioneer in Hungary in data warehousing, data mining and data cleansing projects. In addition to the solutions developed for major companies, DSS Consulting experts have applied these solutions on a number of R&D projects extending from the data mining solutions developed by the company through medical molecular research to different optimization solutions and analytical applications; alongside regular research and development cooperation with many universities.

For biotechnology companies their huge experience and knowledge of managing, analysing and exploring correlations among huge quantities of data, as well as in developing individual software solutions can be invaluable. The complicated data mining algorithms are concealed by the easy to use interfaces controlling their intelligent applications; these can provide solutions to complex mathematical, statistical and data mining problems too. In biotech and health DSS Consulting solutions are also used by companies in Stockholm and Boston.
